PROBIOTICS IN THE NICU: EVIDENCE AND CONTROVERSIES

Miami Neonatology 2021—45th Annual International Conference

Teresa del Moral, MD, MPH, PhD
Professor of Clinical Pediatrics
University of Miami
Leonard M. Miller School of Medicine

Archive of this course is made possible through an educational grant from
Mead Johnson Nutrition

Outline

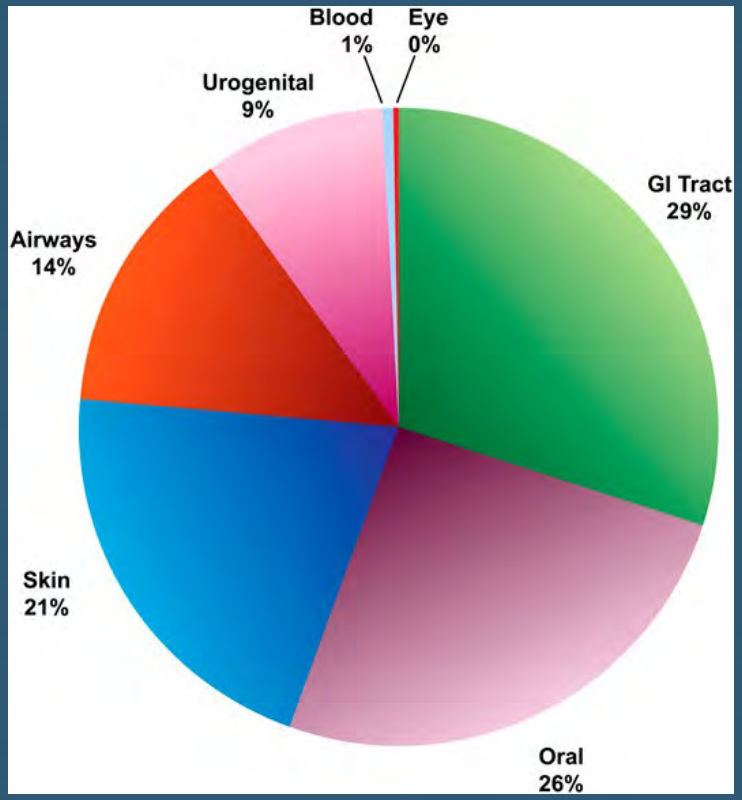
- Premature infant dysbiosis
- Manipulation of the microbiota:

  Probiotics

  - Evidence
  - Controversies

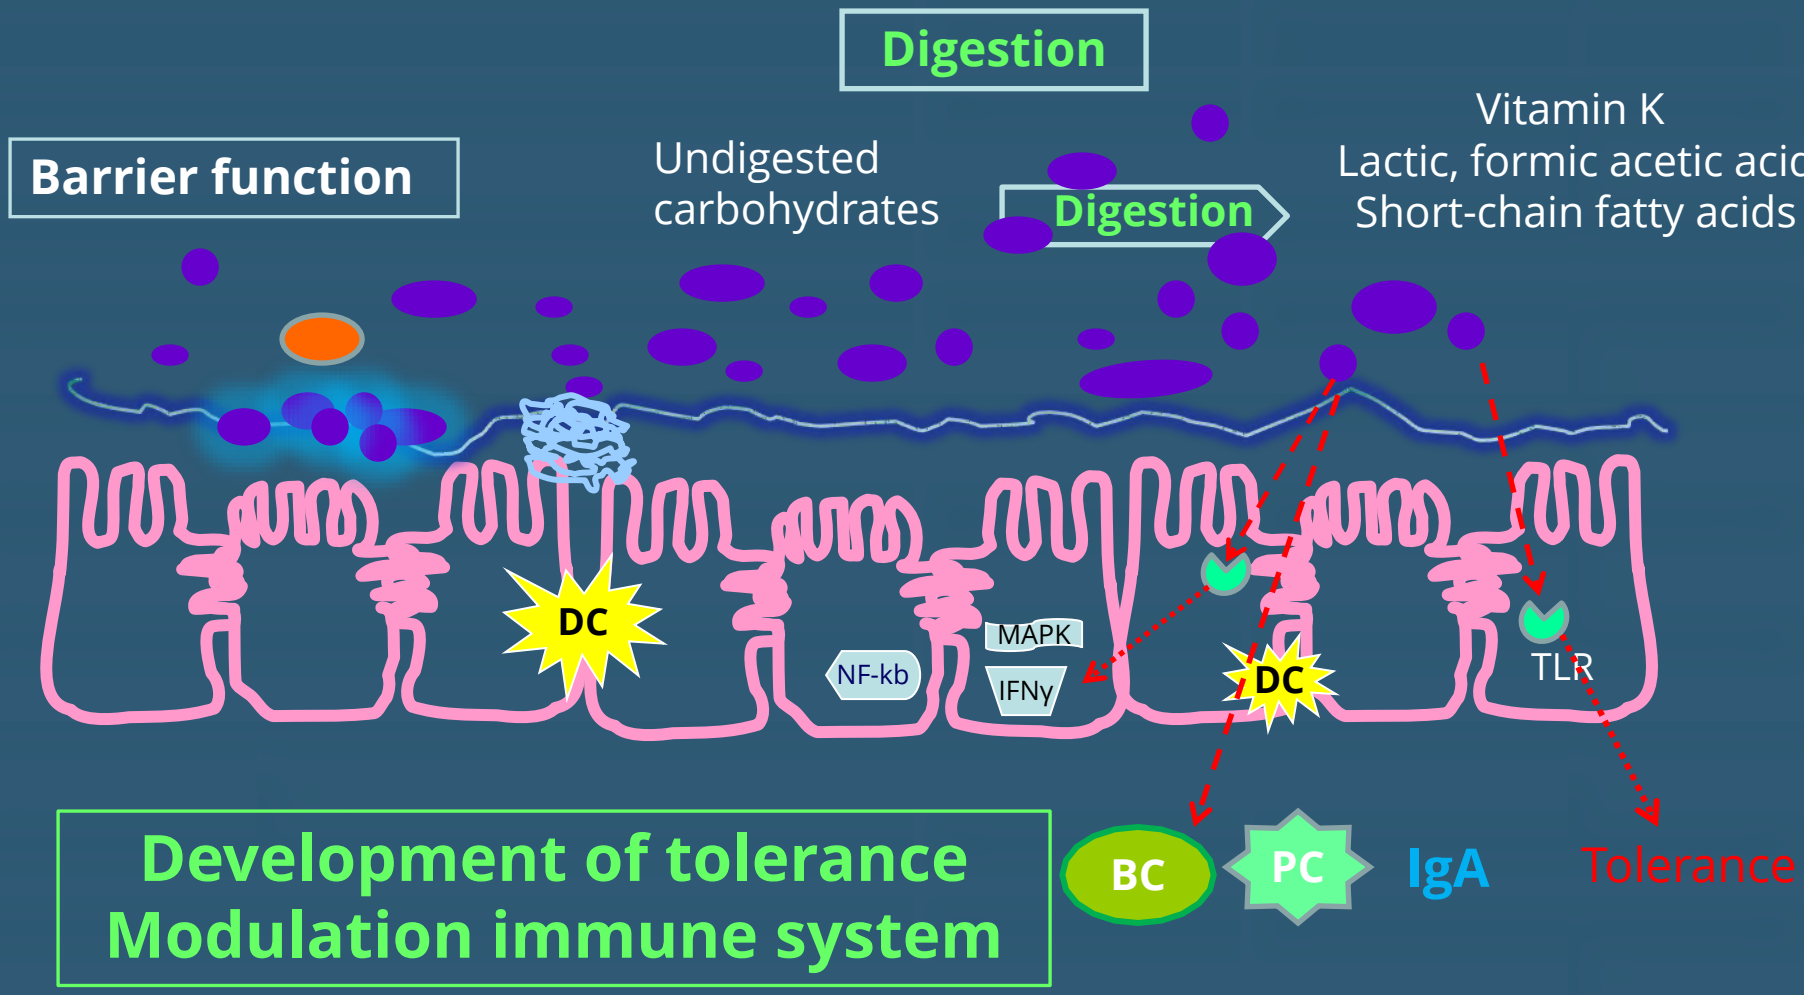
Probiotics, 100 years after Élie Metchnikoff's observation

Human Microbiome Project (HMP)



Bacterial distribution by body site. This figure shows the distribution by body site of bacteria that have been sequenced under the HMP or are in the sequencing pipelines.

Role of the Microbiota in the Immature Intestine



How does the newborn get colonized?

- Intrauterine: partial colonization?
- Delivery: vaginal
- Postnatal: breast feeding

- The placenta harbors a unique microbiome [1]
- Human gut colonization may be initiated in utero by distinct microbial communities in the placenta and amniotic fluid [2]

1. Aagaard K, et al. *Sci Transl Med.* 2014(6);237.

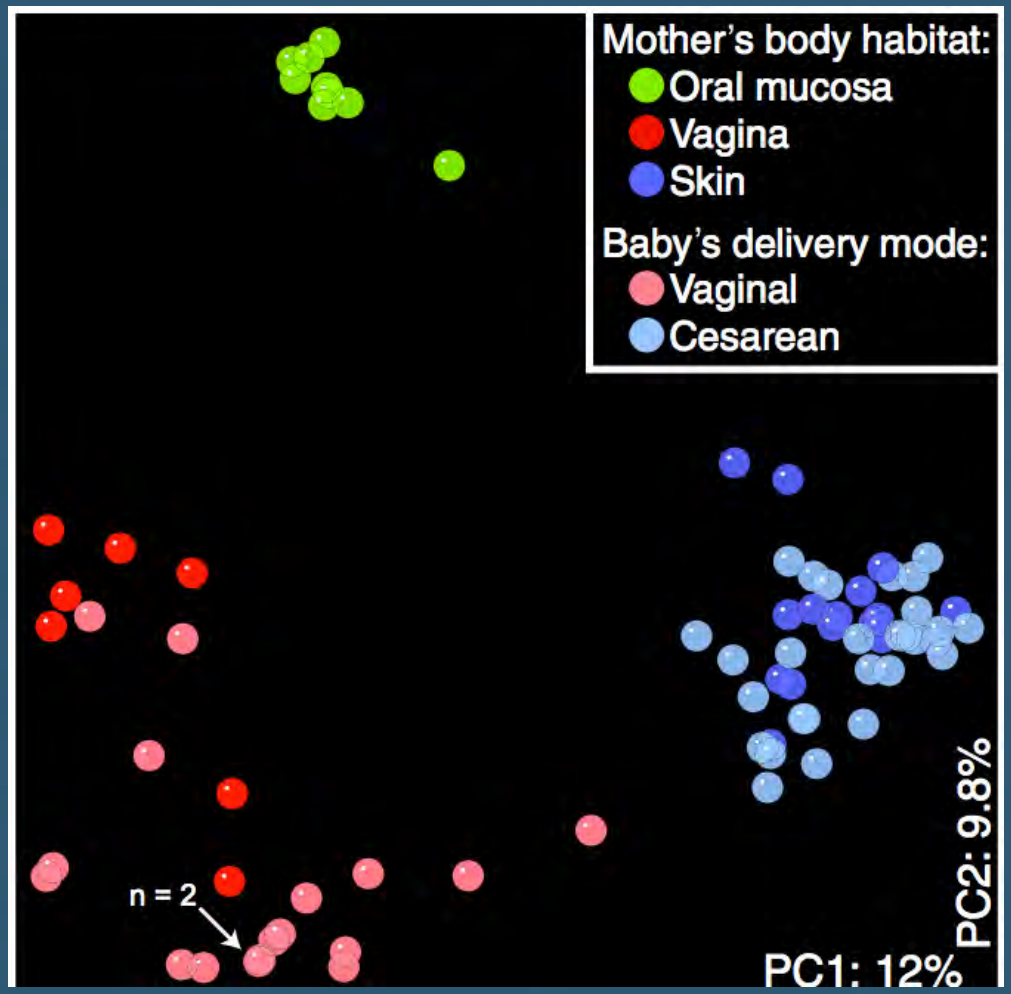
Delivery mode shapes the acquisition and structure of the initial microbiota across multiple body habitats in newborns



Bacterial 16S rRNA gene surveys reveal that the first microbiotas of human newborns are primarily structured by delivery mode

Dominguez-Belloa MG, et al. *Proc Natl Acad Sci USA.*2010;107(26):11971-5. Figure used under the National Academy of Sciences terms for nonprofit educational use.

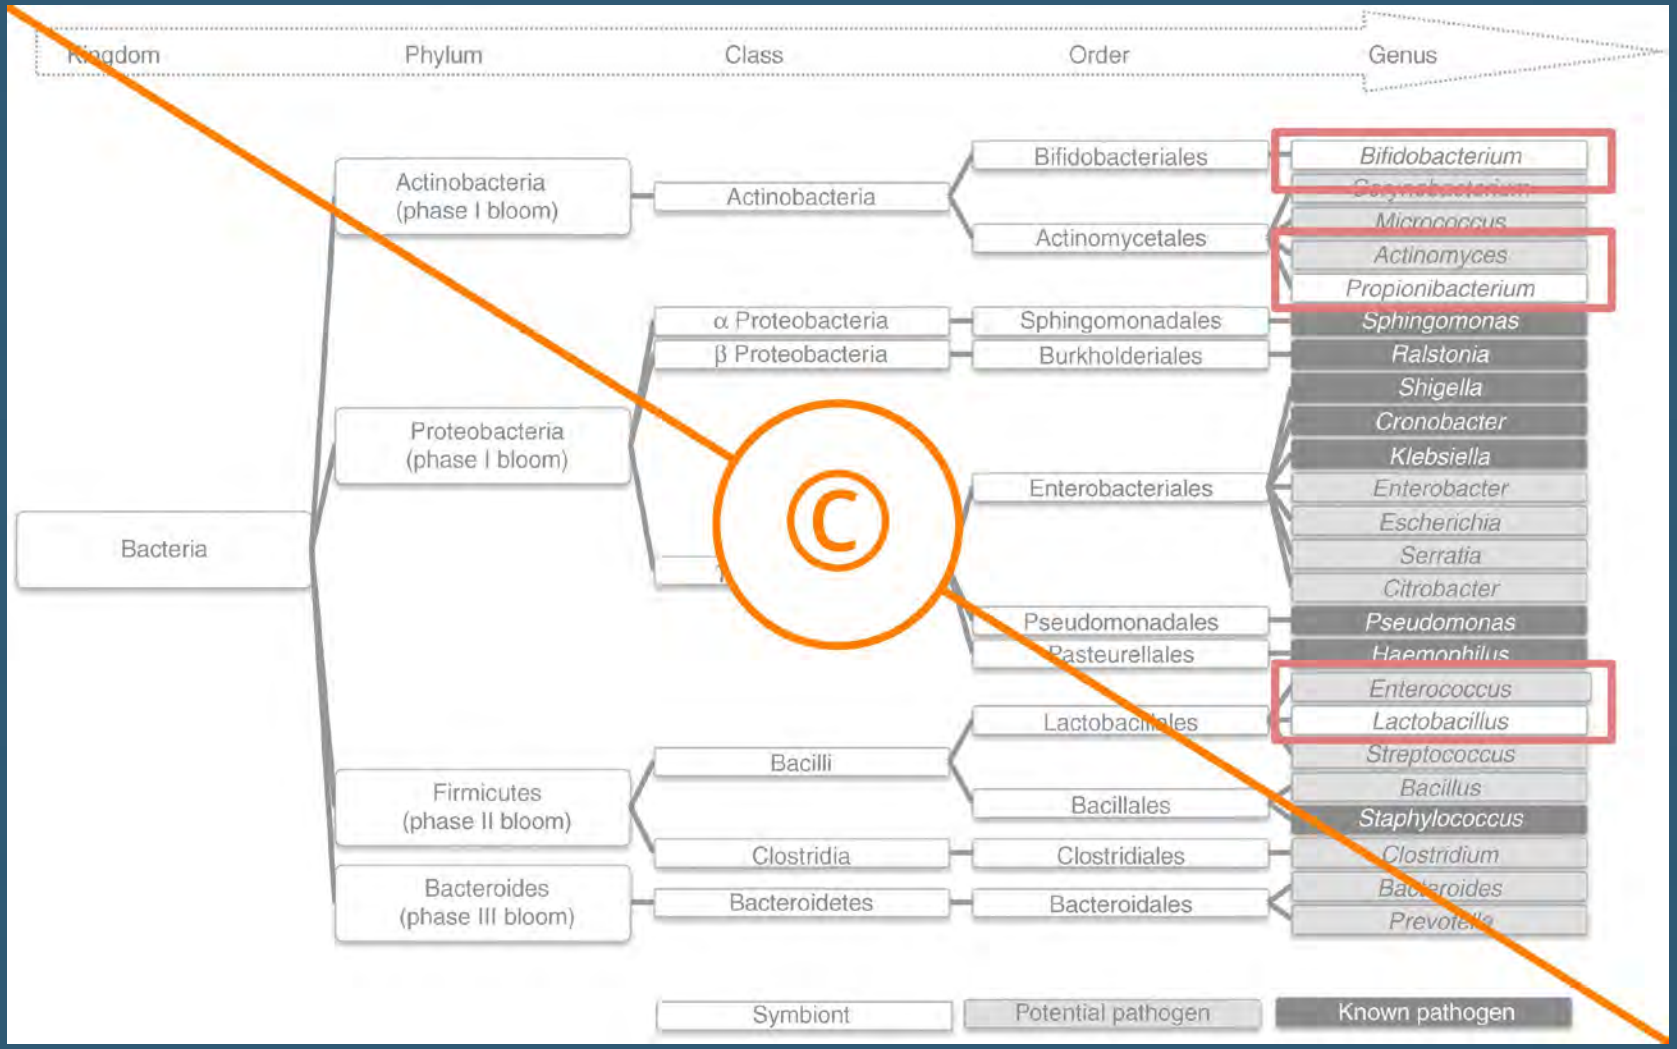
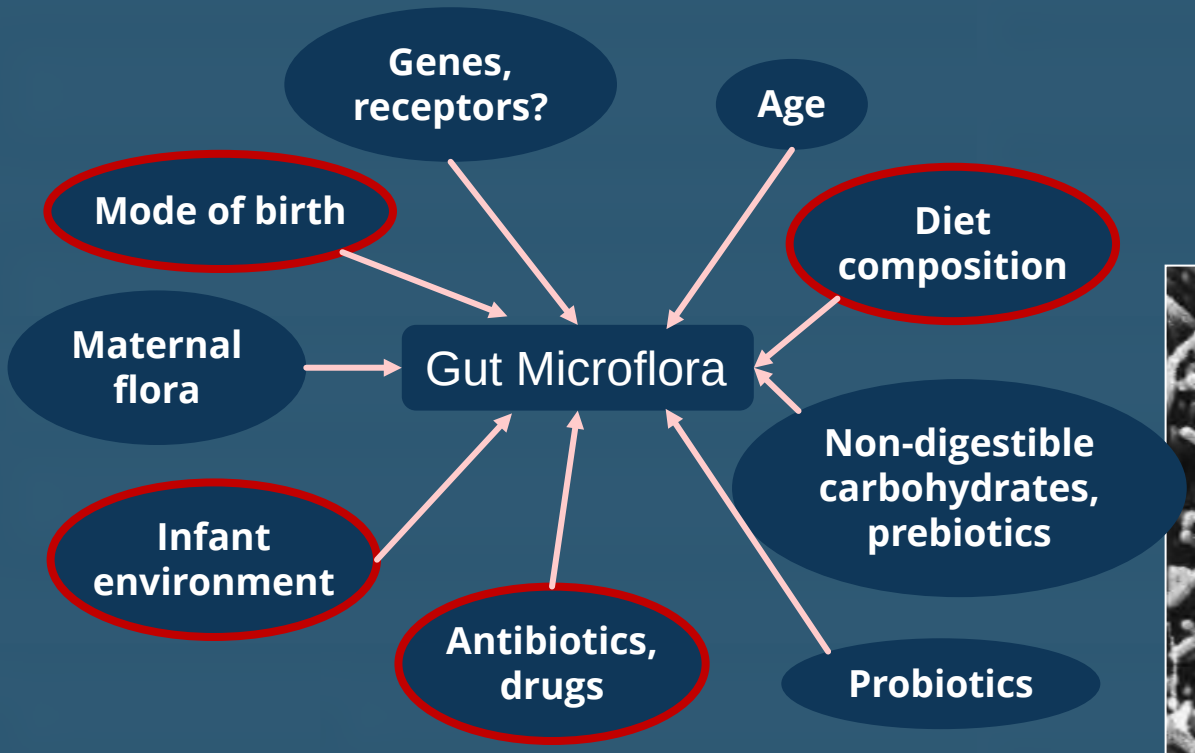
Gut Microbiota of the Very-Low-Birth-Weight Infant



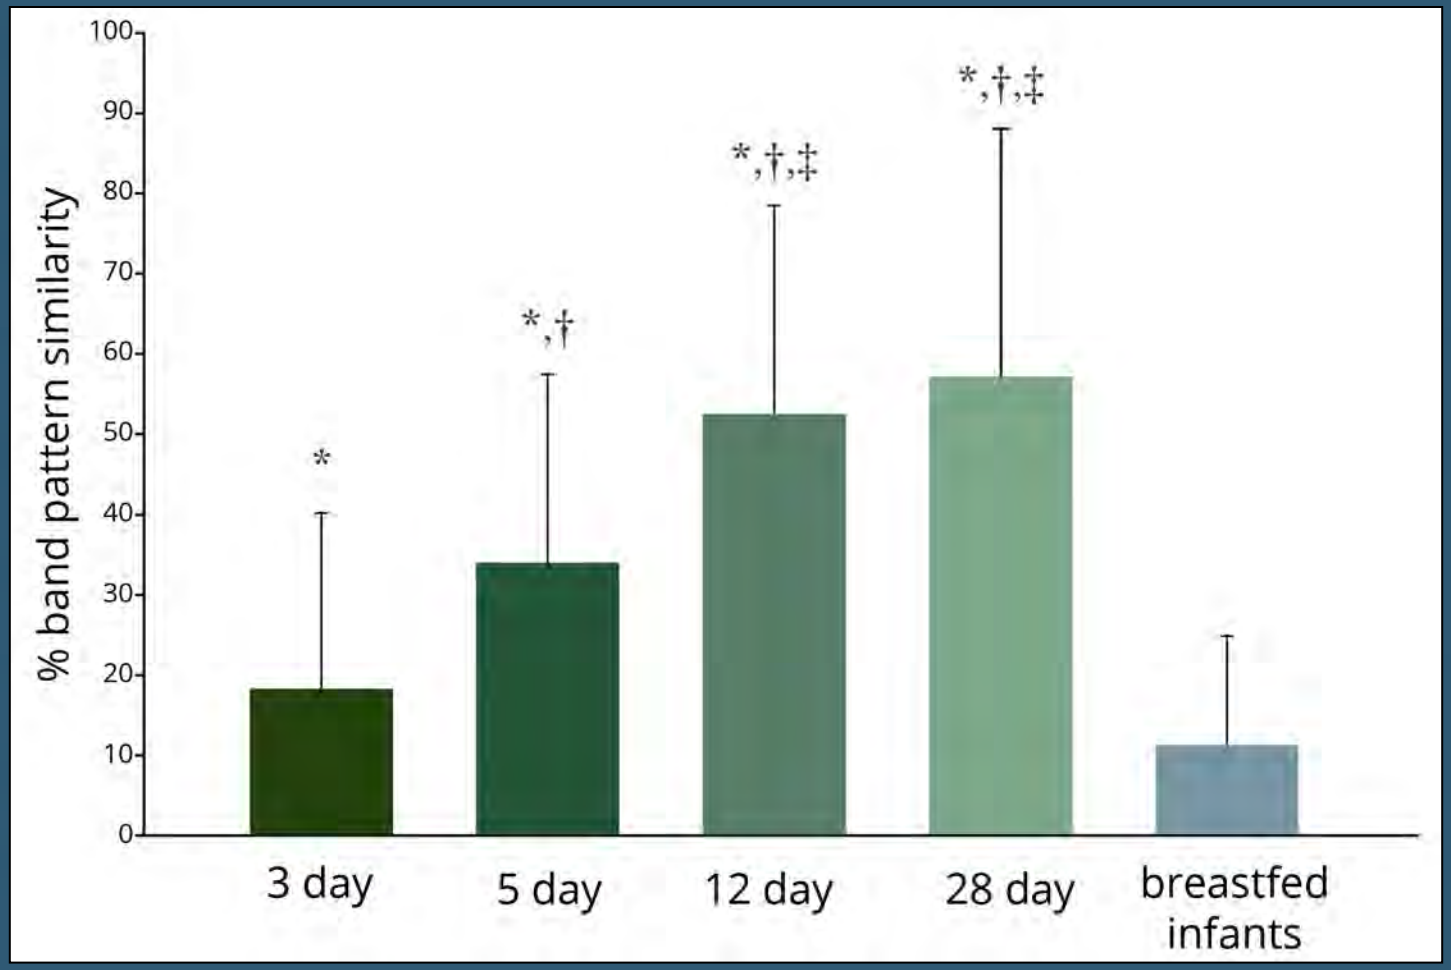
Unger S, et al. *Pediatr Res.* 2015;77:205-213.

Causes of Dysbiosis in Premature Infants



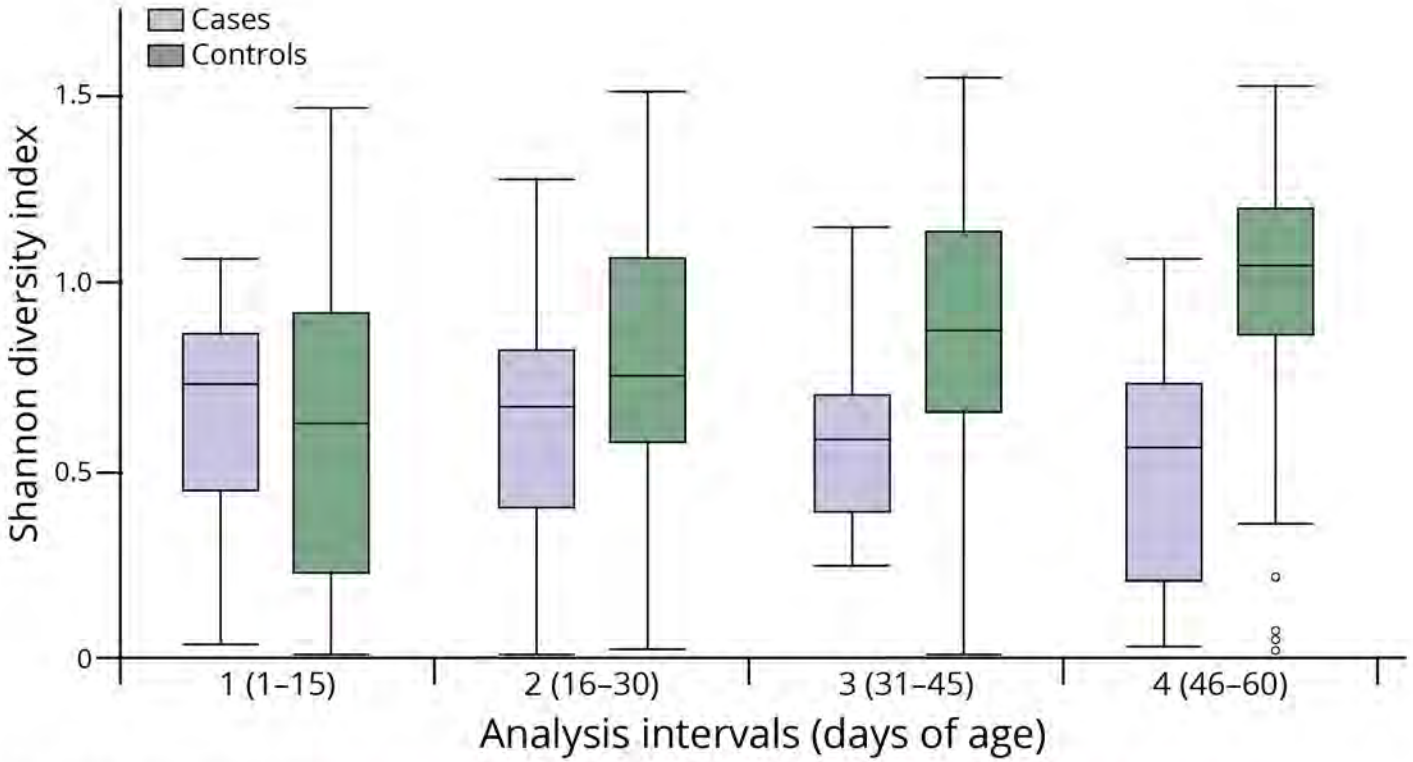
GUT MICROBIOTA DYSBIOSIS

Development of the Intestinal Bacterial Composition in Hospitalized Preterm Infants in Comparison With Breast-Fed, Full-Term Infants



Schwierts A, et al. *Pediatr Res.* 2003;54:393-399. (figure replicated)

Gut Bacteria Dysbiosis and Necrotizing Enterocolitis in Very-Low-Birth-Weight Infants: A Prospective Case-Control Study



Shannon diversity indices in each 15 day analysis interval from the St. Louis cohort
Shows microbial diversity in stools from cases and controls. Horizontal line shows median, box boundaries show 25th and 75th percentiles, and whiskers show the differences between the 25th and 75th percentiles multiplied by 1.5. Values that exceed these boundaries are depicted as open circles. p=0.0004 for time-by-necrotizing-enterocolitis interaction indicating significantly discordant trends in bacterial diversity in stools from cases versus controls.

- Dysbiosis is prevalent in premature infants
- Dysbiosis is associated with morbidity
- Premature infants are one of the populations that can benefit the most from restoration of intestinal microbiota

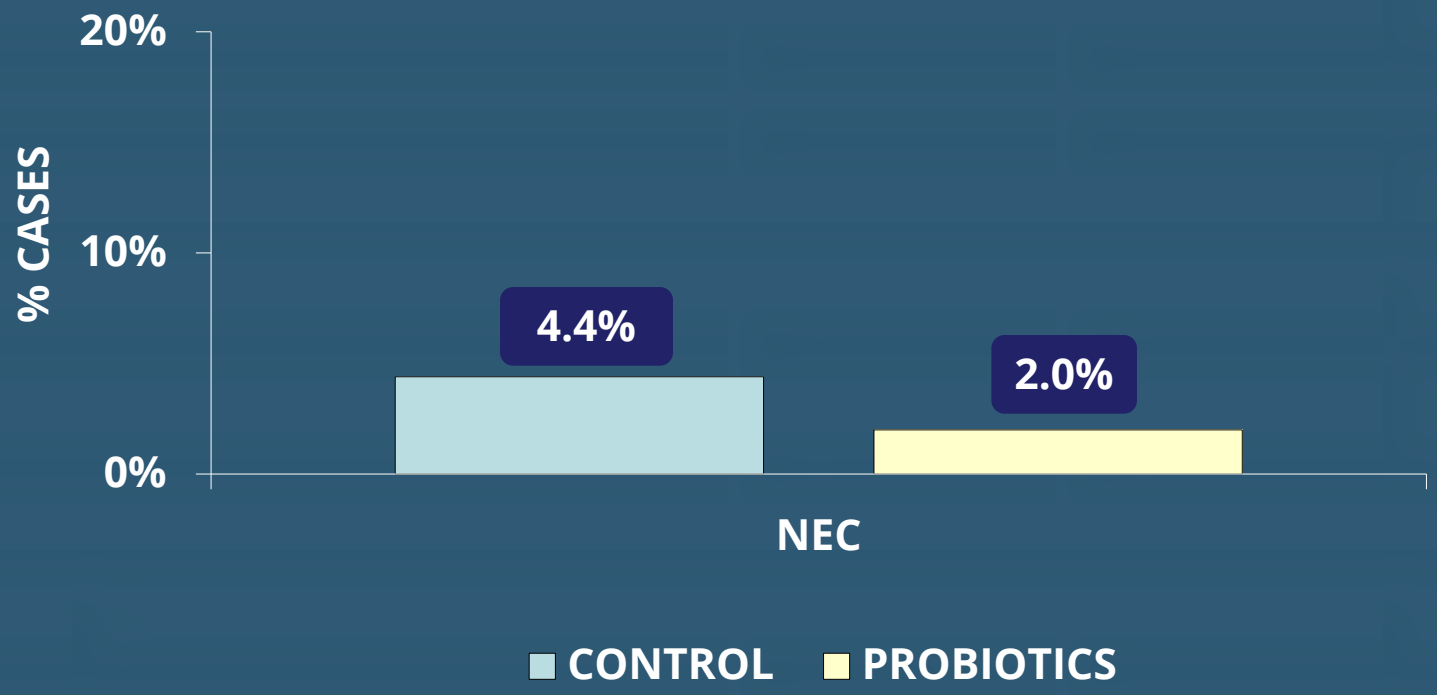
The ProPrems Randomized Trial Investigating the Effects of Probiotics on Late Onset Sepsis in Very Preterm Infants



Bifidobacterium infantis, Streptococcus thermophilus, and *Bifidobacterium lactis*

Jacobs SE, et al. *Pediatrics.* 2013;132(6):1055–1062.

Bifidobacterium breve BBG-001 in Very Preterm Infants: A Randomized Controlled Phase 3 Trial

	Bifidobacterium breve **BBG-001 probiotic (n=650)**	**Placebo (n=660)**	**Adjusted [a] risk ratio (95% CI)**
Necrotizing enterocolitis [b]	61 (9%)	66 (10%)	0.93 (0.68–1.27)
Sepsis [c]	73 (11%)	77 (12%)	0.97 (0.73–1.29)
Death before discharge home [d]	54 (8%)	56 (9%)	0.93 (0.67–1.30)

Data are n (%), unless otherwise indicated.

a. Adjusted for sex, gestational age at birth, and randomization within 24 h of birth. Adjustment by center was excluded because the model did not converge. Allowances for correlations between multiple births are accounted for.

b. Necrotizing enterocolitis (Bell stage 2 or 3).

c. Sepsis is defined as bloodstream infection with non-skin commensals after 72 h postnatal age and before 46 weeks' postmenstrual age.

d. Includes three infants who remained on pediatric wards at the time of analysis and are included as survivors; all were later discharged home.

Bifidobacterium breve BBG-001 in Very Preterm Infants: A Randomized Controlled Phase 3 Trial

Stool PCR at 2 weeks' postnatal age			
PCR positive	416 (84%)	177 (35%)	2.42 (2.06–2.85)
B breve positive by culture or PCR	505 (85%)	219 (37%)	2.30 (1.99–2.66)
Stool culture at 36 weeks' postmenstrual age			
B breve	438 (84%)	253 (49%)	1.69 (1.50–1.91)
MRSA	1 (<1%)	0	Too few data
VRE	3 (1%)	1 (<1%)	2.97 (0.15–57.67)
ESßL	19 (4%)	18 (4%)	0.98 (0.44–2.18)

Probiotics in Very Preterm Infants: PiPS Trial

Unadjusted analysis of colonized infants versus non-colonized infants					
	Colonized infants (n=724)	Non-colonized infants (n=462)	Risk ratio (unadjusted, 95% CI)	Risk ratio (unadjusted, 99% CI)	Adjusted risk ratio (99% CI)
Necrotizing enterocolitis	47 (7%)	58 (13%)	0.52 (0.36–0.75) p =0.0005	0.52 (0.32–0.84) p =0.0005	0.68 (0.43–1.09)
Sepsis	67 (9%)	66 (14%)	0.65 (0.47–0.89) p =0.0082	0.65 (0.42–0.98) p =0.0082	0.88 (0.59–1.31)
Death before discharge	24 (3%)	33 (7%)	0.46 (0.28–0.77) p =0.0033	0.46 (0.24–0.91) p =0.0033	0.68 (0.35–1.29)

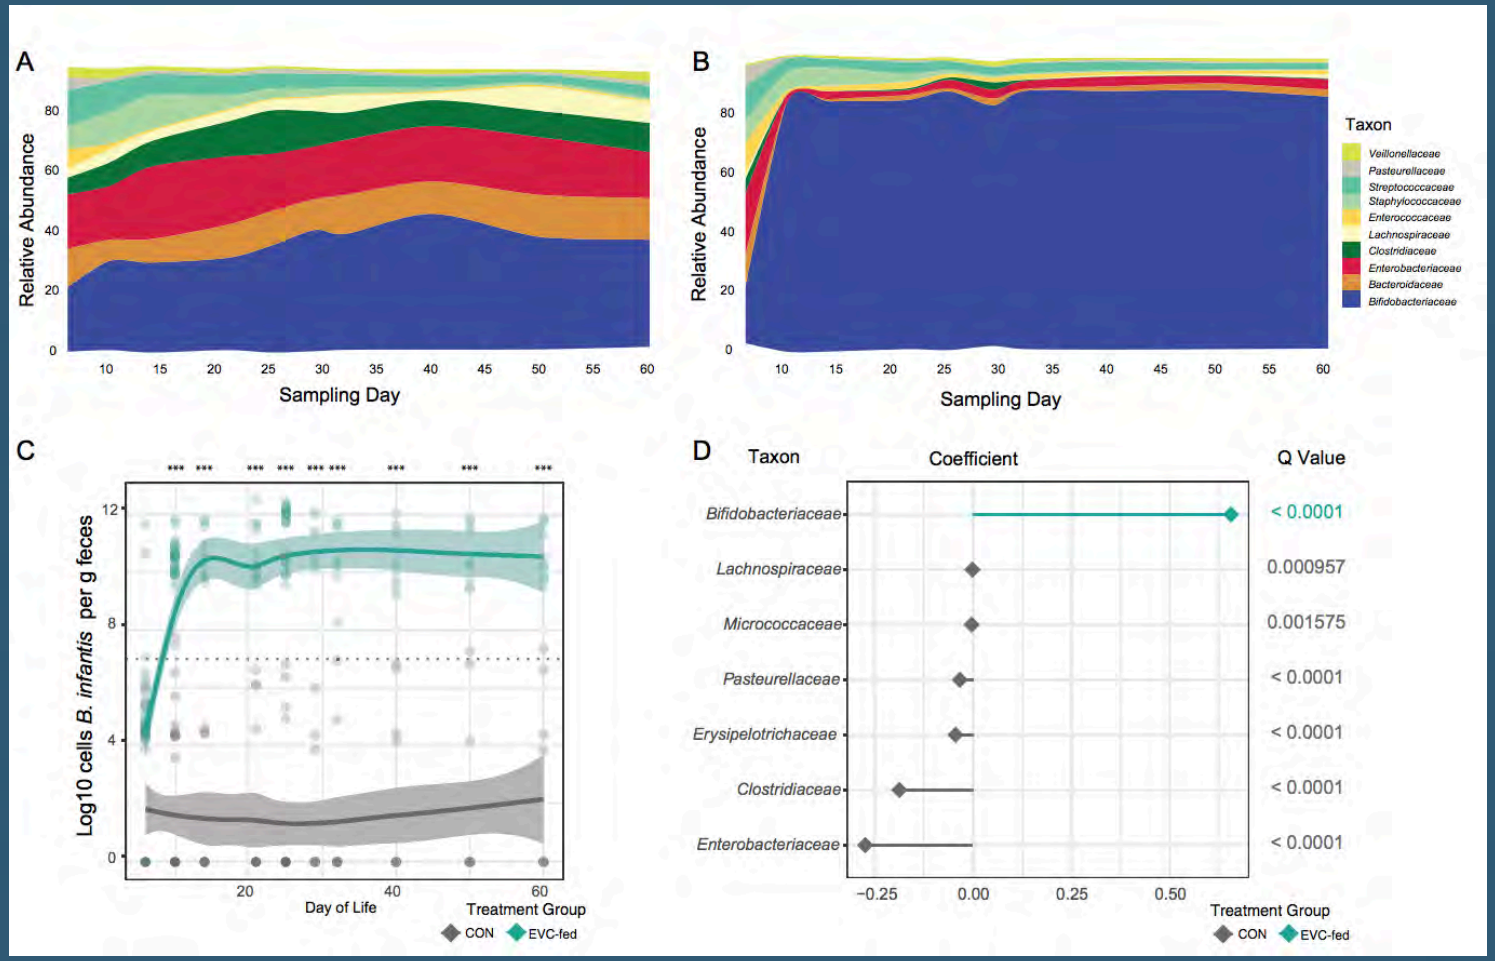
Persistence of Supplemented *Bifidobacterium longum* subsp. *infantis* EVC001 in Breastfed Infants



Colonization by *B. infantis* EVC001 modulates enteric inflammation in exclusively breastfed infants

Bethany M. Henrick[1,2], Stephanie Chew[1], Giorgio Casaburi[1], Heather K. Brown[1], Steven A. Frese[1,2], You Zhou[3], Mark A. Underwood[4,5] and Jennifer T. Smilowitz[4,6]

BACKGROUND: Infant gut dysbiosis, often associated with low abundance of bifidobacteria, is linked to impaired immune development and inflammation—a risk factor for increased incidence of several childhood diseases. We investigated the impact of *B. infantis* EVC001 colonization on enteric inflammation in a subset of exclusively breastfed term infants from a larger clinical study.
METHODS: Stool samples ($n = 120$) were collected from infants randomly selected to receive either 1.8×10^{10} CFU *B. infantis* EVC001 daily for 21 days (EVC001) or br
using 16S ribosomal RNA, proinflammato
time points: days 6 (Baseline), 40, and 6
RESULTS: Fecal calprotectin concentrati
proinflammatory cytokines correlated wi
abundance. Proinflammatory cytokines w
baseline and compared to control infant
CONCLUSION: Our findings indicate that gut dysbiosis (absence of *B. infantis*) is associated with increased intestinal inflammation. Early addition of EVC001 to diet represents a novel strategy to prevent enteric inflammation during a critical developmental phase.

REGULATIONS

- Dietary supplement
  - Center for Food Safety and Applied Nutrition
  - GRAS (Generally Recognized As Safe)

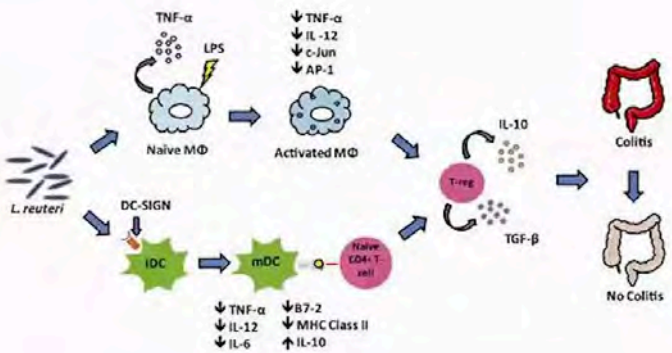
  Most of the products currently available in the United States are categorized as dietary supplements and are not labeled with the number of CFUs for the probiotic strain

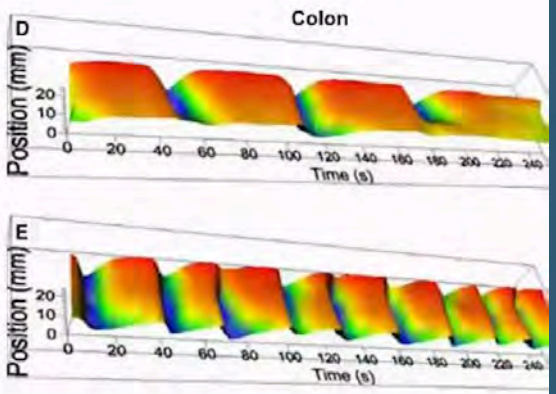
REGULATIONS (continued)

- 2002 International Scientific Association for Probiotics and Prebiotics
  - Defined strain designation
  - Proof of efficacy and effectiveness
  - Safety
- **Live Biotherapeutic (FDA)**
  - A probiotic used to diagnose, cure, treat or prevent diseases is a drug and a biological product
  - The Center for Biologics Evaluation and Research regulates biological products when used for clinical indications
  - IND (US, 21CFR 312)

The Connection Study

Lactobacillus reuteri in IBP-9414





Combats dysbiosis

Reduces gut inflammation

Improves gut motility

A randomized, double blind, parallel-group, placebo controlled study to evaluate the efficacy and safety of IBP-9414 in premature infants 500-1500g birth weight in the prevention of necrotizing enterocolitis – The Connection Study

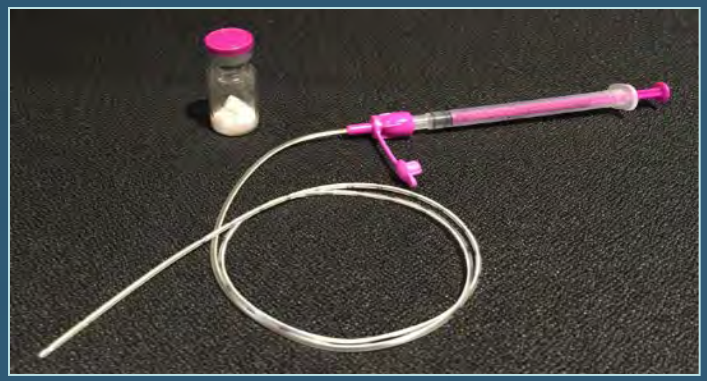
Development of IBP-9414 as a live bacterial therapy for the prevention of NEC.

Under drug manufacture and regulations

IBP-9414 has been approved by the FDA for orphan drug designation for the prevention of NEC.

IBP-9414

- Freeze-dried powder for oral suspension
- Oral-enteral feeding
- Manufacturing process developed to allow opening of IND



A randomized, double blind, parallel-group, dose escalation placebo-controlled multicenter study to investigate the safety and tolerability of IBP-9414 administered in preterm infants

Primary Outcome

	Cohort A: Low dose (n=16)	Cohort A: Placebo (n=13)	Cohort B: High dose (n=16)	Cohort B: Placebo (n=14)	Cohort C: Low dose (n=14)	Cohort C: Placebo (n=16)	Cohort D: High dose (n=15)	Cohort D: Placebo (n=15)
Number of infants with Adverse Events (AEs)	9	11	10	6	13	12	14	14
Total number of AEs	29	30	51	24	51	48	64	58
Number infants with Serious Adverse Events (SAEs)	3	2	2	1	3	2	2	2
Total number of SAEs	6	3	2	3	5	4	2	4
Related AEs	0	0	1	0	3	2	0	2
Related SAEs	0	0	0	0	0	0	0	1
Number infants where AE led to Study Drug withdrawal	0	0	0	0	0	1	0	1
Death	0	0	0	0	0	0	0	0

A randomized, double blind, parallel-group, dose escalation placebo-controlled multicenter study to investigate the safety and tolerability of IBP-9414 administered in preterm infants

Fecal Analysis – Real Time qPCR Analysis

	Cohort A: Low dose	Cohort A: Placebo	Cohort B: High dose	Cohort B: Placebo	Cohort C: Low dose	Cohort C: Placebo	Cohort D: High dose	Cohort D: Placebo
Last day of study treatment	61623* (111110) (n=11)	6 (12) (n=10)	25764* (173111) (n=12)	3 (112) (n=10)	1423^{NS} (10269) (n=5)	7 (874) (n=10)	58251* (311599) (n=8)	40 (75) (n=12)
30 days after last dose	160 (760) (n=7)	297 (371) (n=5)	184 (6437) (n=3)	473 (513) (n=5)	40 (61) (n=9)	59 (184) (n=8)	40 (87) (n=12)	18 (35) (n=12)

*Median (Interquartile range) for bacterial counts per qPCR reaction. * P<0.001 vs placebo and ^{NS} not significant vs placebo.*

- Treatment with IBP-9414 leads to presence of bacterium in the feces on day of last dose: all IBP-treated, 31491 (121875) vs all placebo, 10 (91); P<0.001, Rank sum Wilcoxon
- Cross-contamination did not occur in placebo treated infants
- Smaller infants needed the higher dose to display IBP-9414 in the feces
- 30 days after last dose, the bacteria have been washed out: all IBP-treated, 63 (184) vs all placebo, 42 (290); NS, Rank sum Wilcoxon

Probiotics and Preterm Infants: A Position Paper by the European Society of Paediatric Gastroenterology Hepatology and Nutrition Committee on Nutrition and the European Society for Paediatric Gastroenterology Hepatology and Nutrition Working Group for Probiotics and Prebiotics [1]

- Only products manufactured according to current good manufacturing practices should be used.
- Local laboratories should have the ability to detect probiotic bacteremia.
- The potential risks and benefits are provided to parents of preterm infants.

Use of Probiotics in Preterm Infants [1]

- A pharmaceutical-grade probiotic product is not currently available in the United States.
- Long-term safety remains unknown.
- Current evidence does not support the routine, universal administration of probiotics to preterm infants, particularly those with a birth weight of <1000 g.
- Clinicians must be aware of the lack of regulatory standards for commercially available probiotic preparations manufactured as dietary supplements and the potential for contamination with pathogenic species.

Poindexter B, et al. *Pediatrics.* 2021;147(6):e2021051485.

Probiotics in Perinatology

- Defining the strains or combination of strains that have clinical benefits
- Research to investigate mechanisms of action
- Explore strategies on how and when to deliver probiotic to premature infant
